

An aerial photograph of a town in the Comox Valley, British Columbia, Canada. The town is situated on a hillside overlooking a river. A prominent steel truss bridge spans the river in the background. The foreground shows a steep, grassy slope. The overall scene is bathed in the warm, golden light of late afternoon or early morning.

Not a unique problem: residential woodsmoke in the Comox Valley Regional District

Outline

1. Air pollution and health

2. Systematically identifying smoky days in BC communities

A. Methods

B. Results

3. Mobile monitoring study

A. Methods

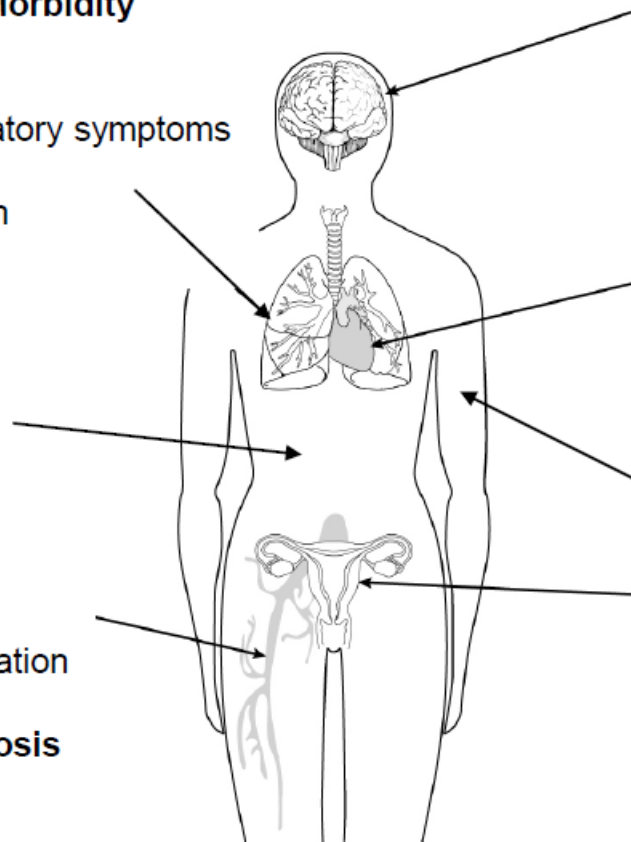

B. Preliminary results

PM_{2.5} affects multiple organs and causes both acute and chronic health effects

- **Respiratory Disease Mortality**
- **Respiratory Disease Morbidity**
- **Lung Cancer**
- **Pneumonia**
- Upper and lower respiratory symptoms
- Airway inflammation
- Decreased lung function
- Decreased lung growth

- **Insulin Resistance**
- **Type 2 diabetes**
- **Type 1 diabetes**
- **Bone metabolism**

- **High blood pressure**
- **Endothelial dysfunction**
- **Increased blood coagulation**
- **Systemic inflammation**
- **Deep Venous Thrombosis**

- **Stroke**
- **Neurological development**
- **Mental Health**
- **Neurodegenerative diseases**
- **Cardiovascular Disease Mortality**
- **Cardiovascular Disease Morbidity**
- **Myocardial Infarction**
- **Arrhythmia**
- **Congestive Heart Failure**
- **Changes in Heart Rate Variability**
- **ST-Segment Depression**
- **Skin Aging**
- **Premature Birth**
- **Decreased Birth Weight**
- **Decreased foetal growth**
- **In uterine growth retardation**
- **Decreased sperm quality**
- **Preclampsia**

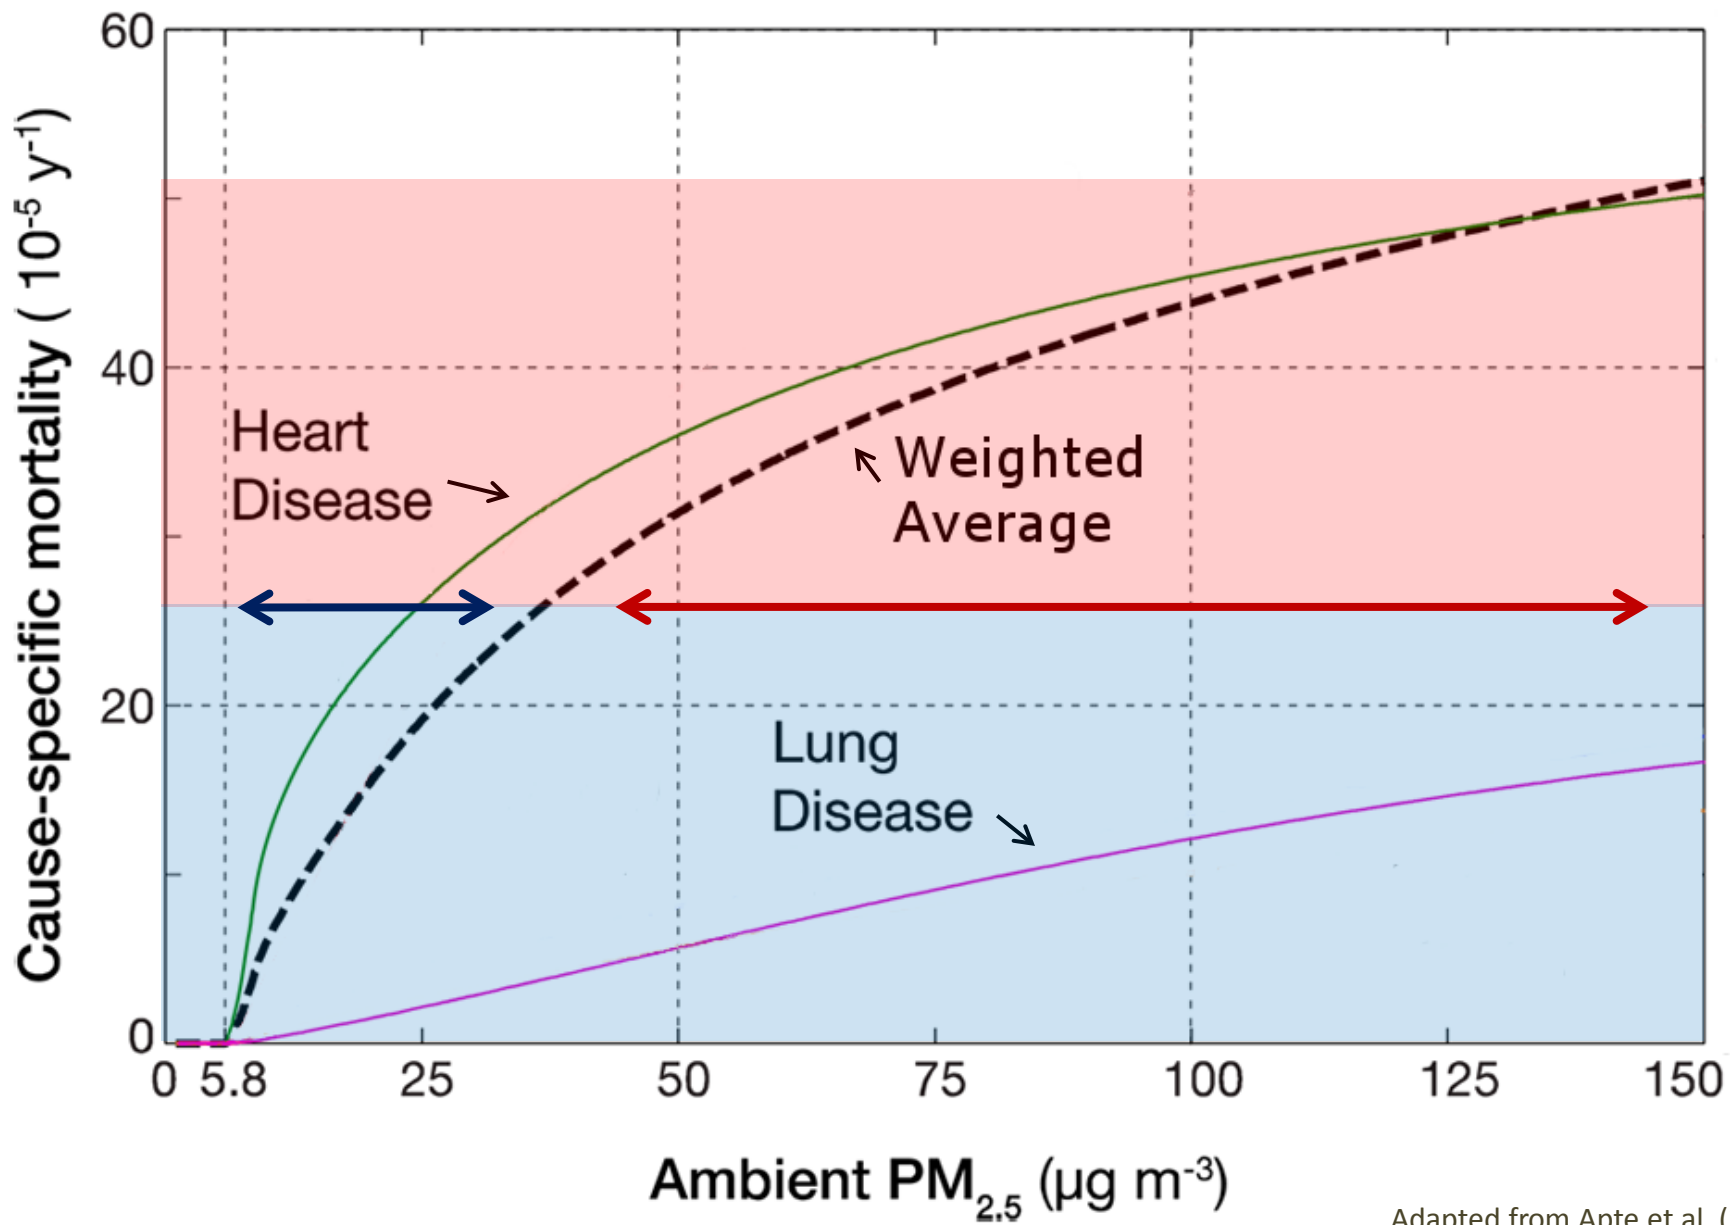

Joint ERS / ATS statement (ERJ 2017)

Exposure-Response Relationship Between PM_{2.5} and Mortality

Comox Valley Emissions Inventory For PM2.5 (TPY) Base Year 2015

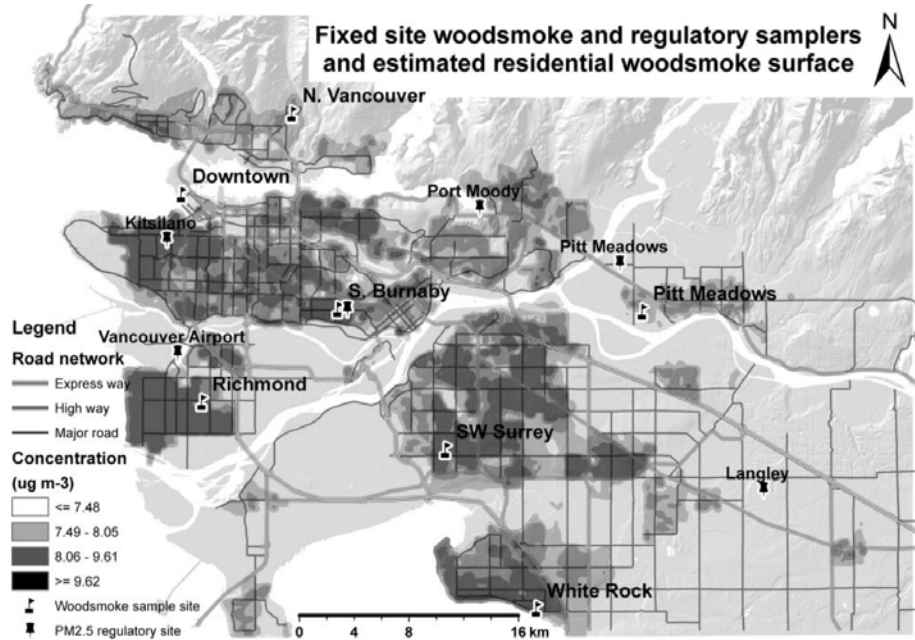

Establishing **Empirical Evidence** for Woodsmoke Pollution

Levoglucosan (the gold standard)

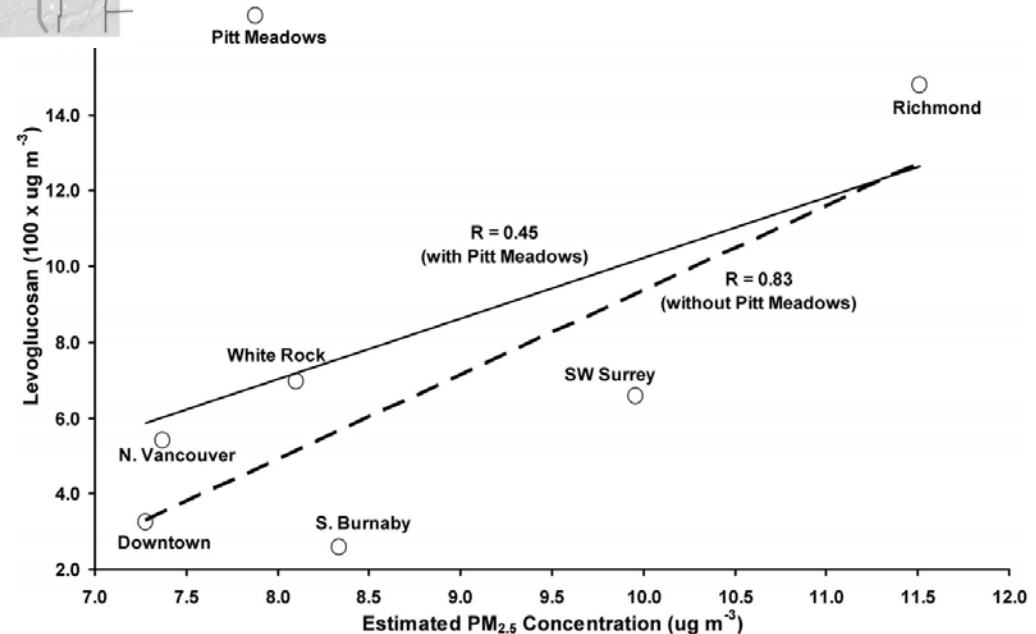

- Requires special study
- Fixed samplers for at least 24 hours
- Expensive lab analysis

Establishing **Empirical Evidence** for Woodsmoke Pollution

Mobile monitoring

- Requires special study
- Requires continuous reading instrument
- Allows spatial characterization

Establishing **Empirical Evidence** for Woodsmoke Pollution

Routine monitoring data

- No special study required
- Common features of smoky days likely identifiable
- Temperature, variability, diurnal patterns

Given that:

1) Woodsmoke sampling is too expensive to conduct in all affected communities

AND

2) Communities want evidence to inform local policy

Question:

Can we use routinely collected $PM_{2.5}$ and temperature data to assess woodsmoke impacts in BC communities?

Three criteria to be classified as a smoky day:

1. Mean daily temperature $\leq X$

AND

2. Standard deviation (SD) of 1-hour PM_{2.5} concentrations $\geq Y$

AND

3. Daytime to Nighttime PM_{2.5} Ratio $\leq Z$

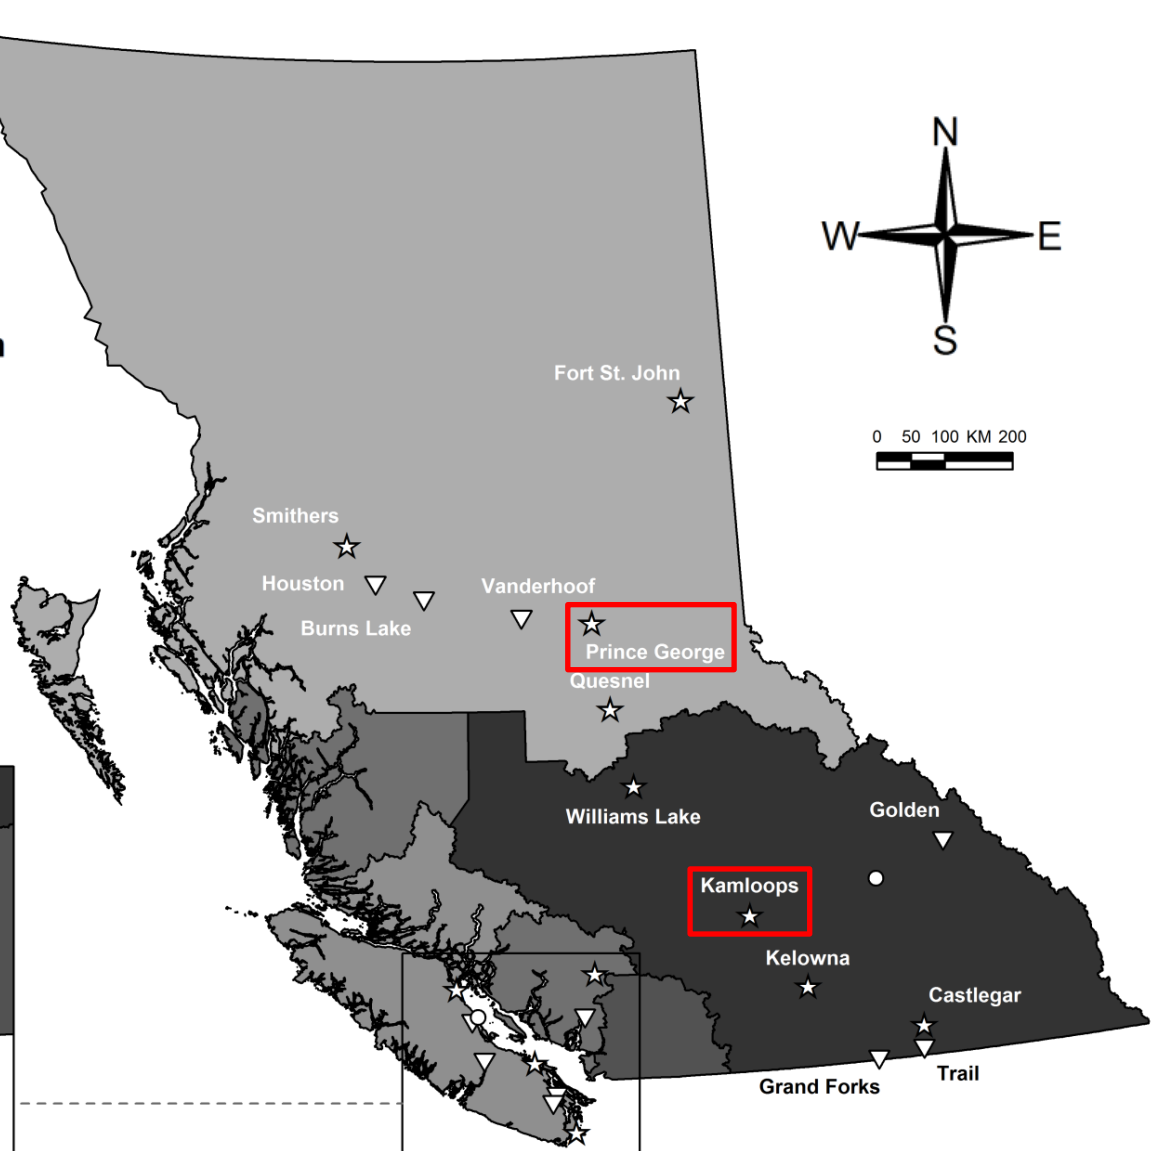

What are the ideal values for the **X**, **Y**, and **Z**?

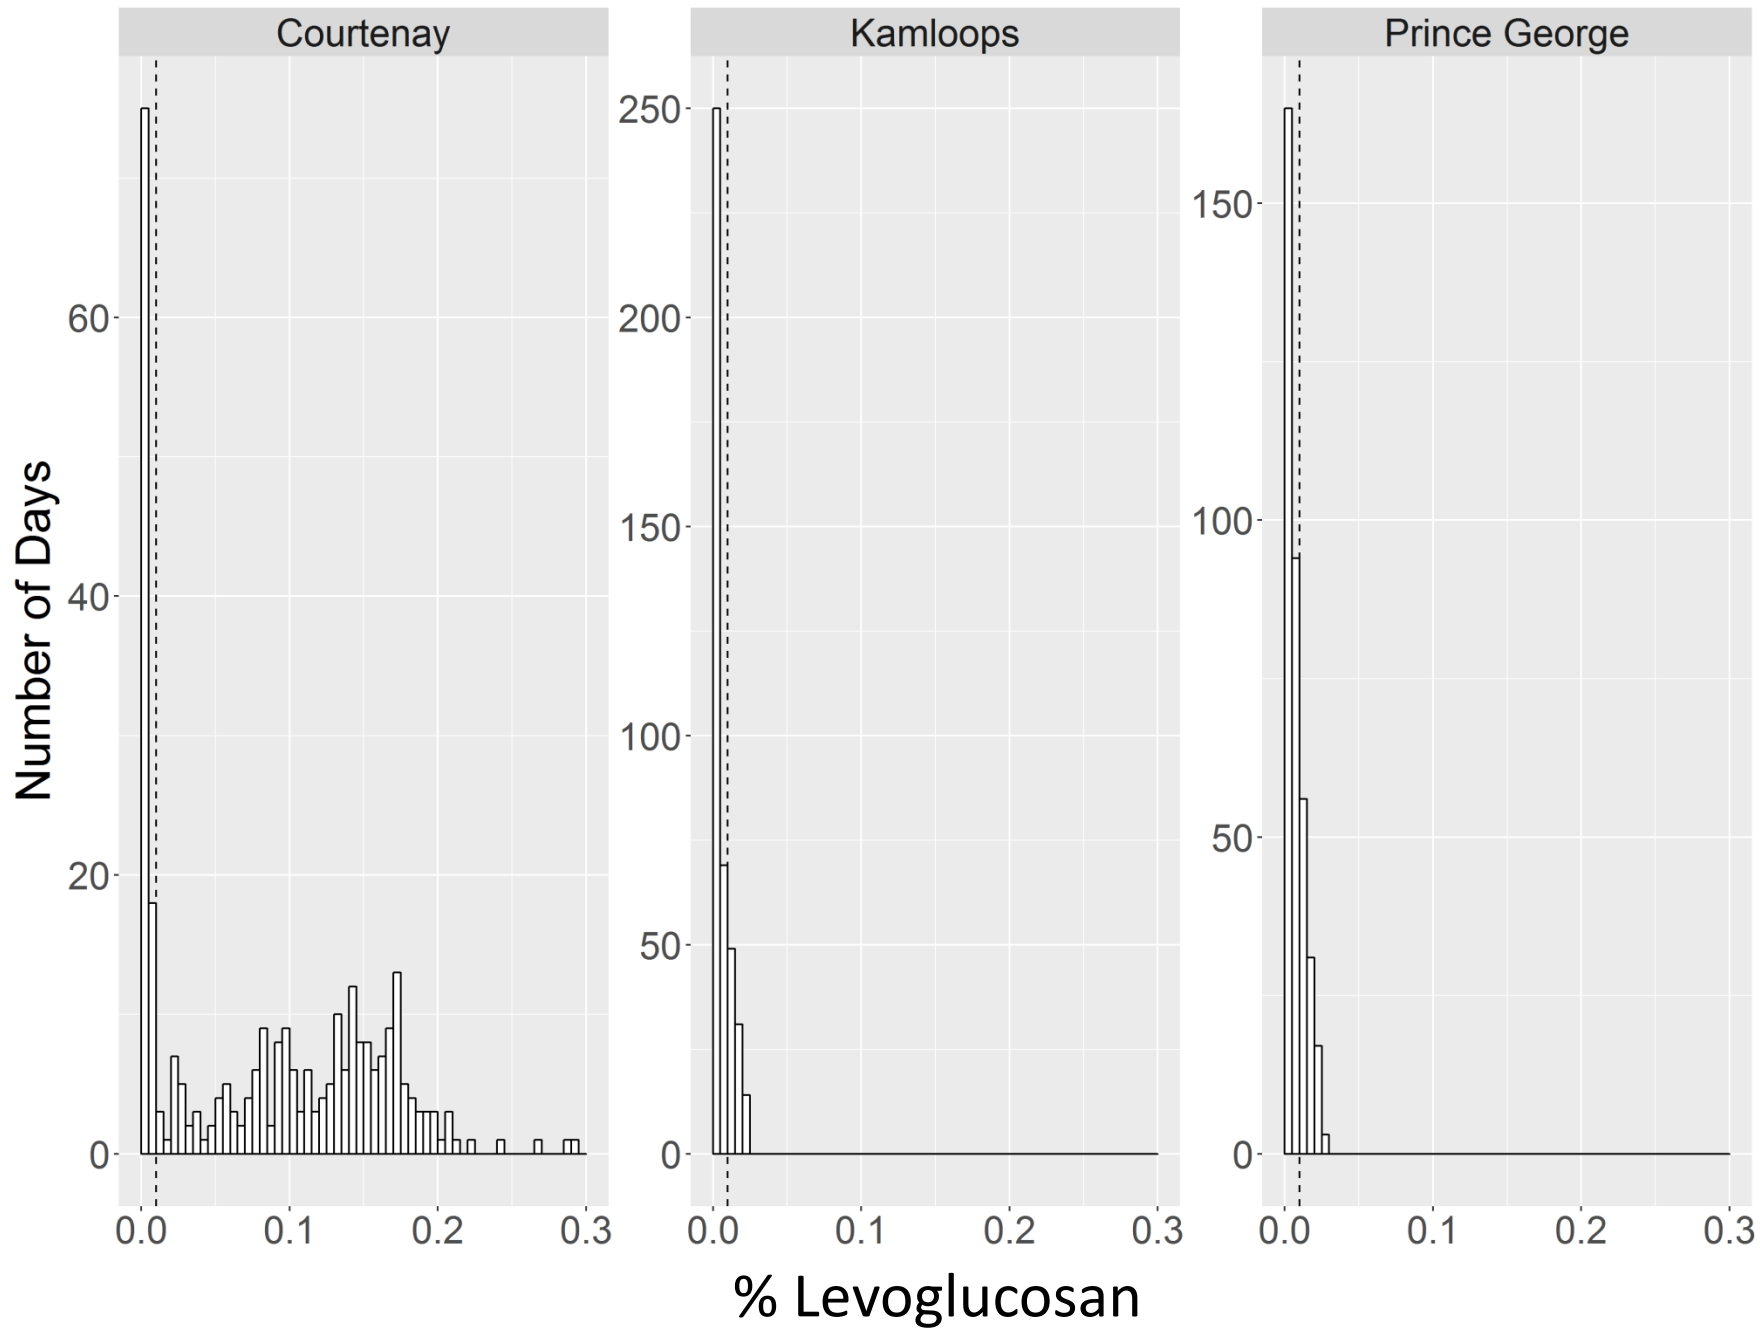

Optimize thresholds based on levoglucosan data

What Data Do We Have to Work With?

- Interior Health
- Fraser Health
- Vancouver Coastal Health
- Vancouver Island Health
- Northern Health

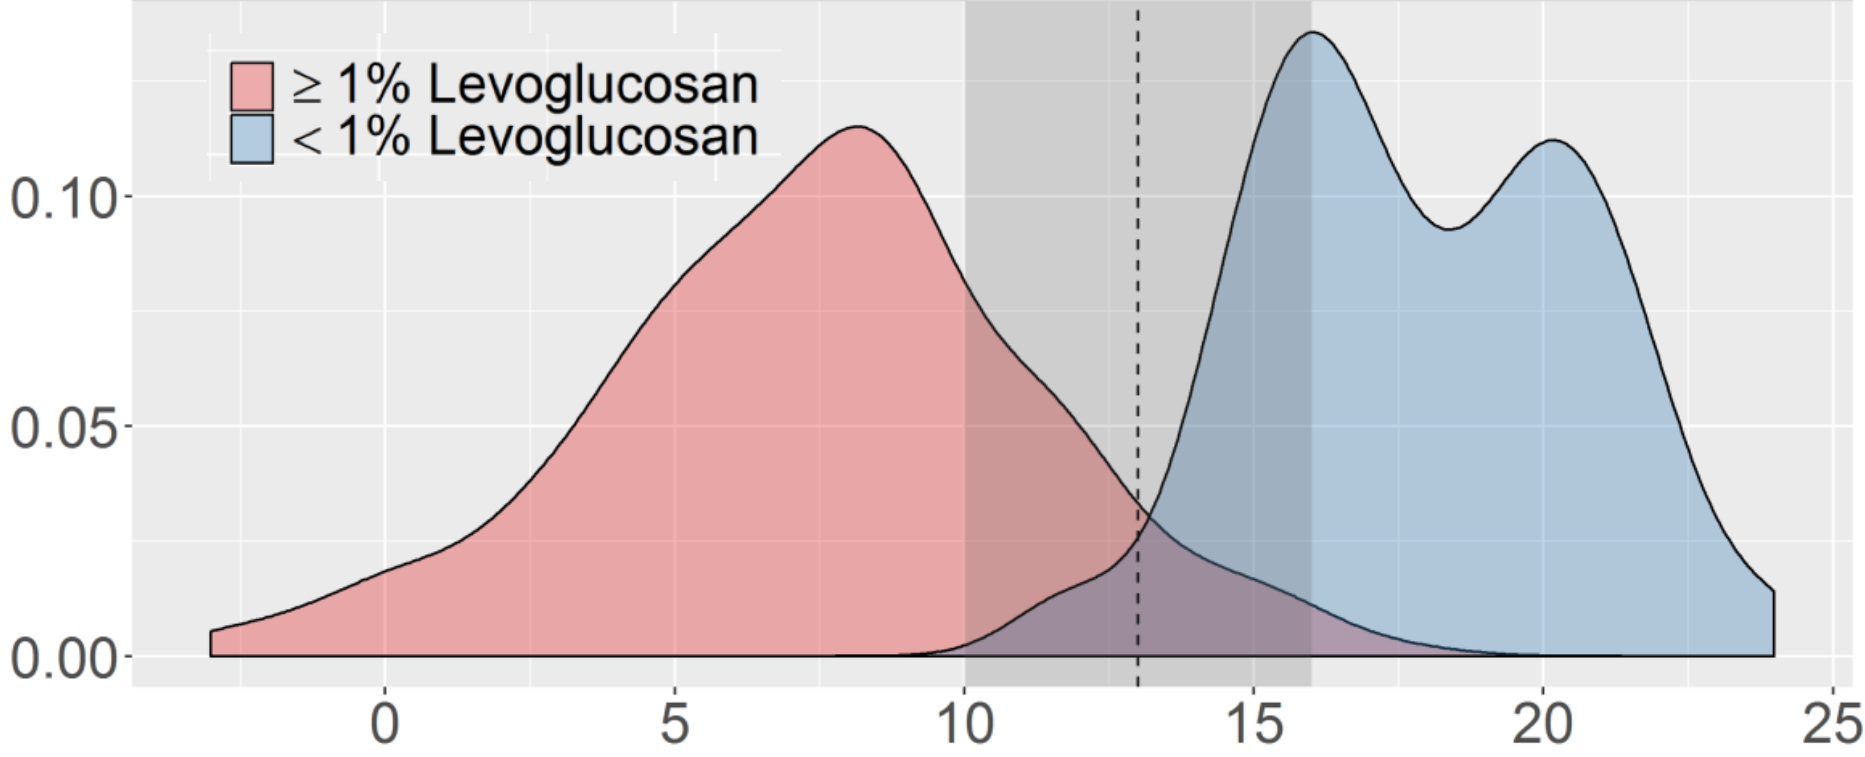

- ☆ PM & Weather Station
- ▽ PM Station
- Weather Station

Mean Temperature

- $\geq 1\%$ Levoglucosan
- $< 1\%$ Levoglucosan

Standard Deviation of PM_{2.5} Concentrations

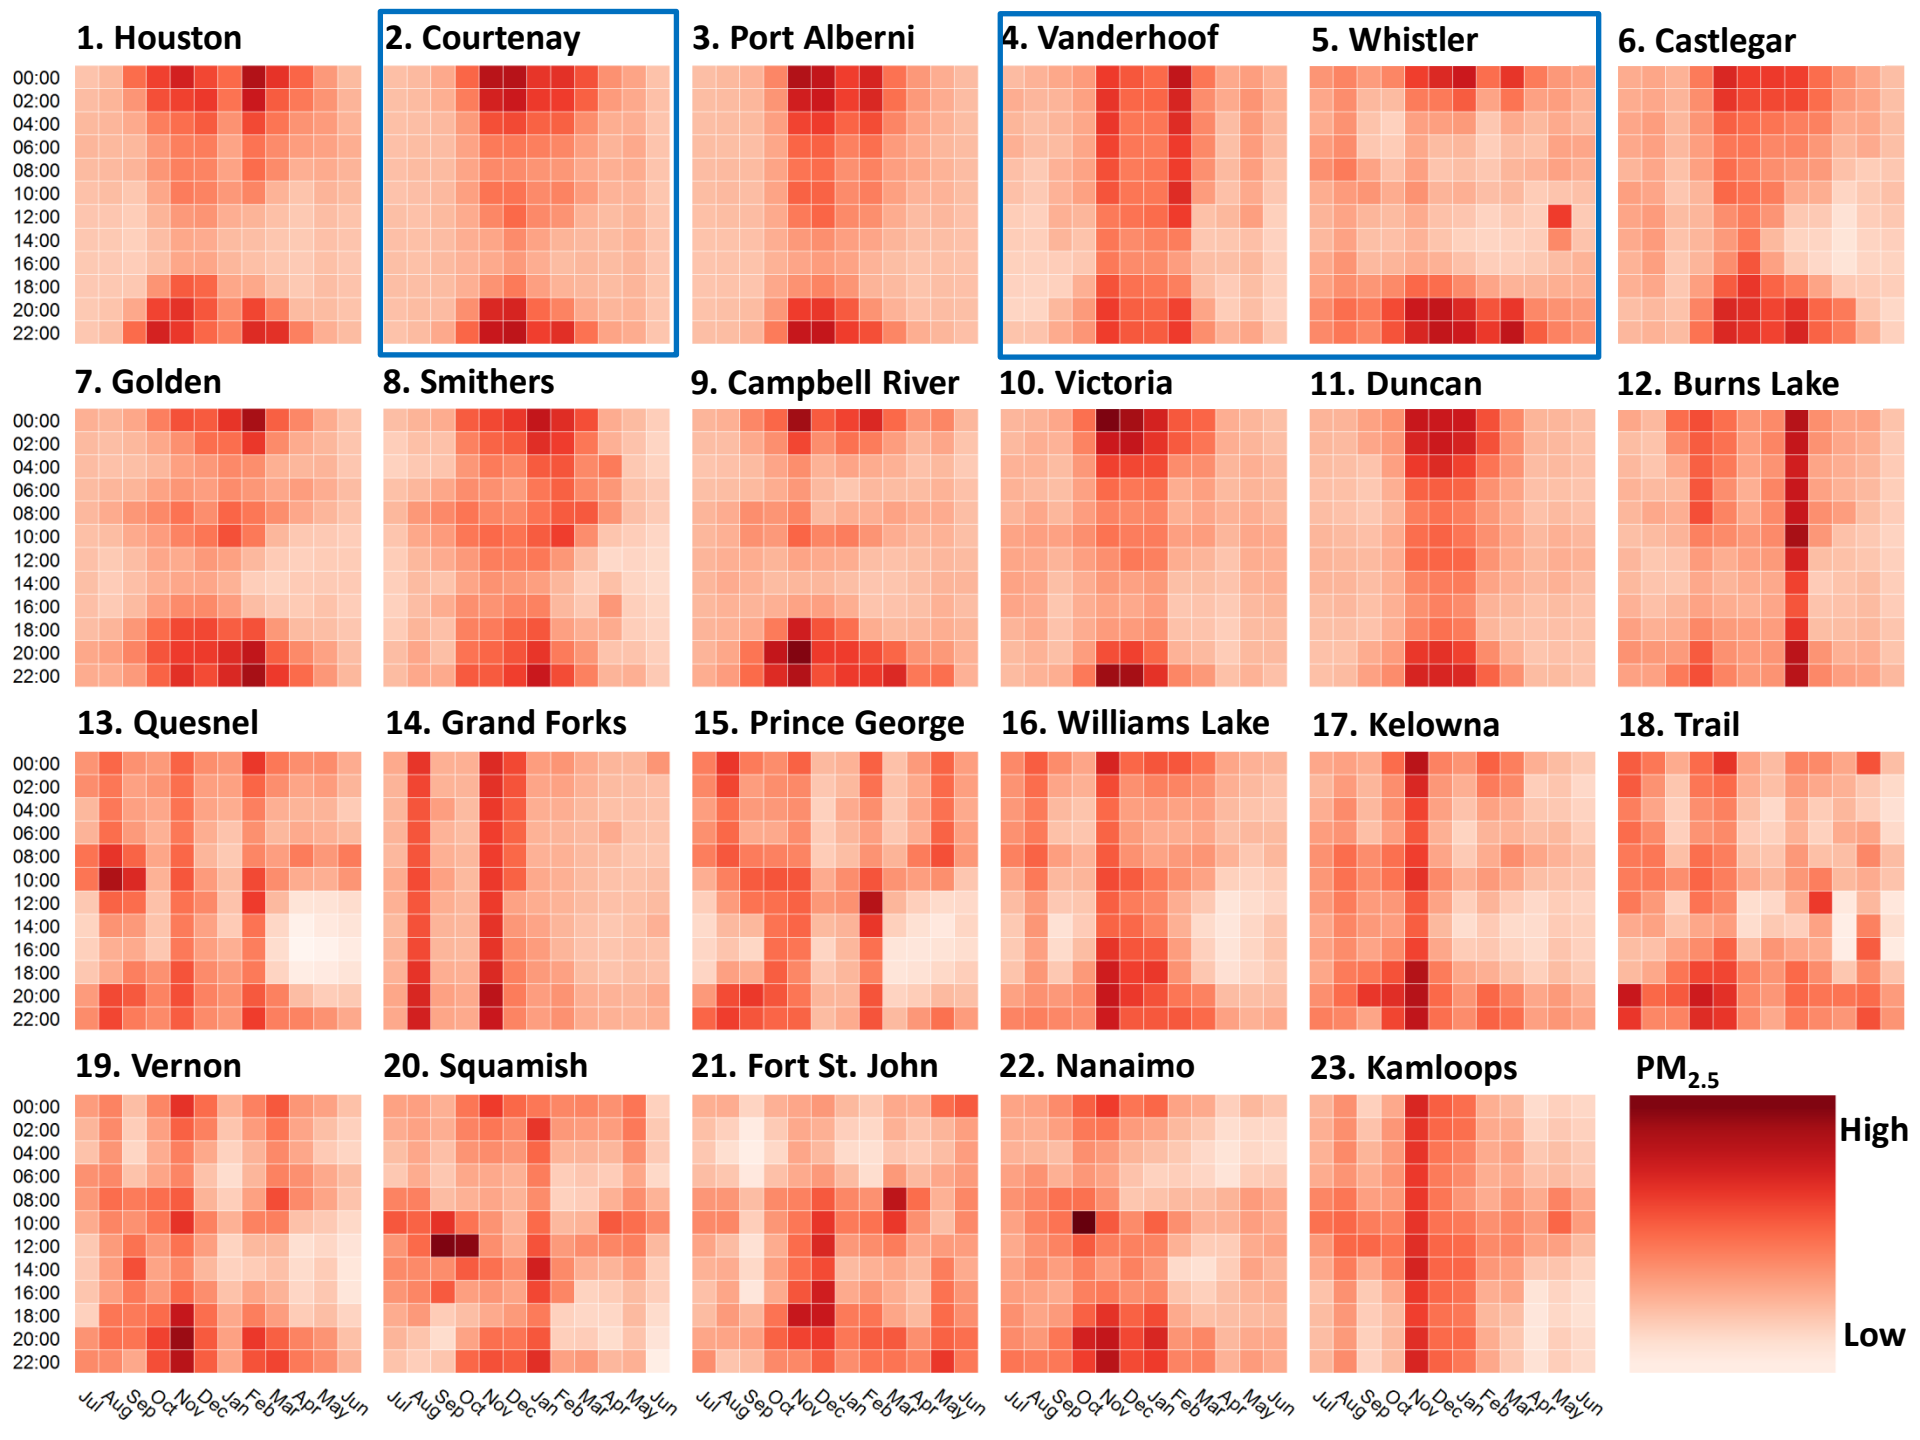

Legend:
Red box: $\geq 1\%$ Levoglucosan
Blue box: $< 1\%$ Levoglucosan

Daytime/Nighttime PM_{2.5} Ratio

■ $\geq 1\%$ Levoglucosan
■ $< 1\%$ Levoglucosan

Nephelometer vs. multi-channel aethelometer
